Foundations of Bejan's Constructal Theory

Origins and Conceptual Framework

Constructal Theory, introduced by Bejan in 1996, posits that for a system to persist over time, it must facilitate easier access to flows—be they heat, fluids, or other entities. This principle suggests that flow architectures naturally evolve toward configurations that minimize resistance and maximize efficiency.

At its core, the theory asserts that the design of natural systems—from river basins to vascular networks, and engineered heat exchangers—follows the same evolutionary principles aimed at
